CAST RACK - 2 WiFi Streams

WLAN audio streaming without internet

The CAST RACK - 2 WiFi Streams is a device specially developed by KafkaPUREAudio to transmit music and voice signals (in hi-fi quality) in WLAN networks without Internet. The mobile receivers (see above) are connected to the CAST RACK via the WLAN network.

Areas of use are e.g. Interpreting applications, hearing aid support, conferences, "pure listening" applications, silent conference, silent disco, etc.

The patented LINEAPP CAST software can be operated via a web interface. Both the name of the stream and a graphic can be entered. The CAST RACK - 2 WiFi Streams is stand-alone and requires no further operation after commissioning. Parallel running streams are possible through the use of multiple CAST RACK units. The CAST license is valid for one year from the first commissioning and can be renewed at any time. During the license period, all software updates are free. Professional audio and network connections allow easy connection to other components.

BENEFITS
Easy installation and start-up
Transformer-balanced audio input
Replaces desktop and laptop Streaming computer
Receiver-side cost savings through BYOD
Integrated web interface
Low-latency hi-fi Sound
Full freedom of movement for users in the WLAN coverage
Multiple streams possible at any time
Free software updates during License duration
Lowest bandwidth of the streaming transmission
Highest reliability due to single streams
Individual hardware configuration like eg
Digital audio input possible
Shock resistant aluminum housing
Professional connections

All Bring-Your-Own-Device (BYOD) receivers download the LINEAPP CAST Receiver software to their mobile devices for free via the iOS or Android App Store, log in to the CAST RACK network and then start the app. The device screen automatically shows all available streams. Just tap to listen to the stream you want using Bluetooth or wired headphones and switch to other streams (with just one click). If no stream is tapped, the bandwidth is reduced to a minimum. The receiver can move freely within the WLAN coverage. If you leave the "WLAN zone", all streams on the screen turn gray - if you receive WLAN again, the device automatically connects and the available streams appear again in their usual color.
